Claims:

Please cancel claims 1-29, 31 and 33 without prejudice or disclaimer as to the subject matter thereof.

1.-31 (canceled)

- 32. (currently amended) A computer readable medium for storing instructions for performing a method, said method involving generating an invoice for the provision of medical services relating to communicating information between an implantable medical device (IMD) implanted in a patient and a remote computer system, the method utilizing a system for at least one of monitoring the performance of the IMD, monitoring the health of the patient and remotely delivering a therapy to the patient through the IMD, the IMD being capable of bidirectional communication with a communication module located external to the patient's body, the system comprising the IMD, the communication module, a mobile telephone capable of being operably connected to the communication module and capable of receiving information therefrom or relaying information thereto, means for generating an involce in response to information relating to the IMD being relayed or transmitted from or to the mobile phone, a remote computer system, and a communication system capable of bi-directional communication with the mobile phone and the remote computer system, the medium comprising:
- (a) software encoded instructions for operating the IMD to determine whether medical attention should be provided;
- (b) in response to the determination made in step (a), software encoded instructions for uploading data from the IMD to the communication module;

Page 3

- (c) software encoded instructions for transferring the data from the communication module to the mobile telephone and thence on to the remote computer system via the communication system;
 - (d) software encoded instructions for remotely analyzing the data;
- (e) software encoded instructions for determining on the basis of the analyzed data whether remedial action respecting at least one of the IMD and the patient is required;
- (f) software encoded instructions for remotely executing the determined remedial action via the communication system, and
- (g) software encoded instructions for automatically generating an invoice in response to at least one of steps (a), (b), (c), (d), (e) and (f) being carried out,

wherein the communications module is adapted to detect whether at least one of a component defect and a software defect exists within one of the IMD exists—and the remote computer system, and in the event that the component defect or software defect is detected, software encoded instructions for determining whether a remote repair available, and if not, software encoded instructions means for simultaneously broadcasting an alert to: a remote health care provider, a remote computer, a remote expert-based computer system.

33. (canceled)

34. (new) An apparatus, comprising:

means for generating an invoice for the provision of medical services relating to communicating information between an implantable medical device (IMD) implanted in a patient and a remote computer system, said means utilizing a system for at least one of monitoring the performance of the IMD, monitoring the health of the patient and remotely delivering a therapy to the patient through

Page 4

the IMD, the IMD being capable of bi-directional communication with a communication module located external to the patient's body, the system comprising the IMD, the communication module, a mobile telephone capable of being operably connected to the communication module and including means for receiving information therefrom and means for relaying information thereto,

means for generating an invoice in response to information relating to the IMD being relayed or transmitted from or to the mobile phone,

a remote computer system, and

a communication system capable of bi-directional communication with the mobile phone and the remote computer system, said communication system further comprising:

- means for for operating the IMD to determine whether medical (a) attention should be provided;
 - in response to the determination made in step (a), means for uploading data from the IMD to the communication module;
 - means for transferring the data from the communication module to (c) the mobile telephone and thence on to the remote computer system via the communication system;
 - (d) means for remotely analyzing the data:
- (e) means for determining on the basis of the analyzed data whether remedial action respecting at least one of the IMD and the patient is required;
- means for remotely executing the determined remedial action via (f) the communication system, and
- means for automatically generating an invoice in response to at (g) least one of steps (a), (b), (c), (d), (e) and (f) being carried out,

wherein the communications module is adapted to detect whether at least one of a component defect and a software defect exists within one of the IMD and the remote computer system, and wherein in the event that the component defect or software defect is detected, implementing means for

Page 5

determining whether a remote repair available, and if not, means for simultaneously broadcasting an alert to: a remote health care provider, a remote computer, a remote expert-based computer system.

35. (new) A method, comprising:

generating an invoice for the provision of medical services relating to communicating information between an implantable medical device (IMD) implanted in a patient and a remote computer system, said method utilizing a system for at least one of monitoring the performance of the IMD;

monitoring the health of the patient; and

remotely delivering a therapy to the patient through the IMD, wherein said IMD is capable of bi-directional communication with a communication module located external to the patient's body,

wherein said system further comprises:

the IMD:

the communication module;

a mobile telephone capable of being operably connected to the communication module and capable of receiving information therefrom or relaying information thereto;

means for generating an invoice in response to information relating to the IMD being relayed or transmitted from or to the mobile phone,

a remote computer system; and

a communication system capable of bi-directional communication with the mobile phone and the remote computer system, said method further comprising:

- operating the IMD to determine whether medical attention should (a) be provided;
 - in response to the determination made in step (a), uploading data (b) from the IMD to the communication module;

Applicants: Haller et al. Serial No. 09/765,218

Art Unit: 2142 Page 6

- transferring the data from the communication module to the mobile (c) telephone and thence on to the remote computer system via the communication system:
- (d) remotely analyzing the data:
- (e) determining on the basis of the analyzed data whether remedial action respecting at least one of the IMD and the patient is required;
- remotely executing the determined remedial action via the **(f)** communication system, and
- automatically generating an invoice in response to at least one of (g) steps (a), (b), (c), (d), (e) and (f) being carried out,

wherein the communications module is adapted to detect whether at least one of a component defect and a software defect exists within one of the IMD and the remote computer system, and in the event that the component defect or software defect is detected, determining whether a remote repair available, and if not, simultaneously broadcasting an alert to: a remote health care provider, a remote computer, a remote expertbased computer system.
